Rchain Validator Sale Member Opportunity: Executive Summary
Ryan Boudinot, Lucius Gregory Meredith

We are pleased to introduce you to an investment opportunity with Rchain Cooperative, a blockchain applications company poised to become a leader in distributed network technology. Rchain was founded in 2016 to build upon the promise of blockchain as a technology that promotes trust and accountability in networks.

The great promise of blockchain has been hindered by scalability. Rchain has focused on the underlying architecture of the blockchain to build systems capable of scaling to the size of Facebook and processing transactions at the volume and speed of Visa.

Rchain president Greg Meredith, a mathematician and former partner and principla software architect at Microsoft, created a new execution model called RSpace and new language called Rholang for executing and writing smart contracts that run concurrently. Smart contracts allow for verifiable transactions without the participation of a third party.

We see applications for Rchain's innovations in many sectors, from governance to pharmaceuticals to entertainment. As a technology that uses smart contracts, Rchain provides more transparent transactions and inspires greater confidence in its users.

Rchain also recognizes another barrier to blockchain scalability—the demand on utilities as these networks grow. Rchain's efficiencies include environmentally responsible computational processes that do not depend on mining, thereby greatly relaxing demands on the electrical grid.

The corporate structure of Rchain is a cooperative, a legal designation that grants governance responsibility to the collective to promote transparency and prevent corruption. In this way, the governance of Rchain is consistent with the values of collective responsibility that the technology was designed to promote. Our mission is to build a more hopeful future for society and our planet.

Rchain is making 80M RHOC tokens available for purchase for parties who are willing to stake the network. Investors will bond tokens and commit hardware for nodes that validate transactions on the network. We ask that participants provide a hardware provisioning and maintenance plan. This can either be provided directly or by an approved partner, such as Pyrofex, who will manage the technical portion of the engagement.

The tokens will be sequestered until MainNet launch, at which time they will be converted to the validator bond on which they will earn seniorage as well as transaction fees.

An investment in Rchain is an investment in the foundational infrastructure of entirely new economies built on consumer confidence and corporate transparency. We welcome you to join us in creating this more hopeful future and thank you for your consideration.
